Site Closure at SECARB Cranfield

• The SECARB activities at Cranfield has ended June 5, 2015, with P&A of the last observation wells and end of surface activities.

• Commercial injection by Denbury under regulation by Mississippi Oil & Gas Board continues (natural CO$_2$ at this site, no GHG credits).
Speculation: If CO$_2$ provider/operator had been collecting GHG credits what would happen at end of injection

- Legal questions of access and rights after end of production
- Upward migration of CO$_2$ after producer are shut in: Integrity of P&A gas production wells at center of structure?
- Potential for future additional production activities “quaternary recovery” will CO$_2$ be retained?
