# Outline

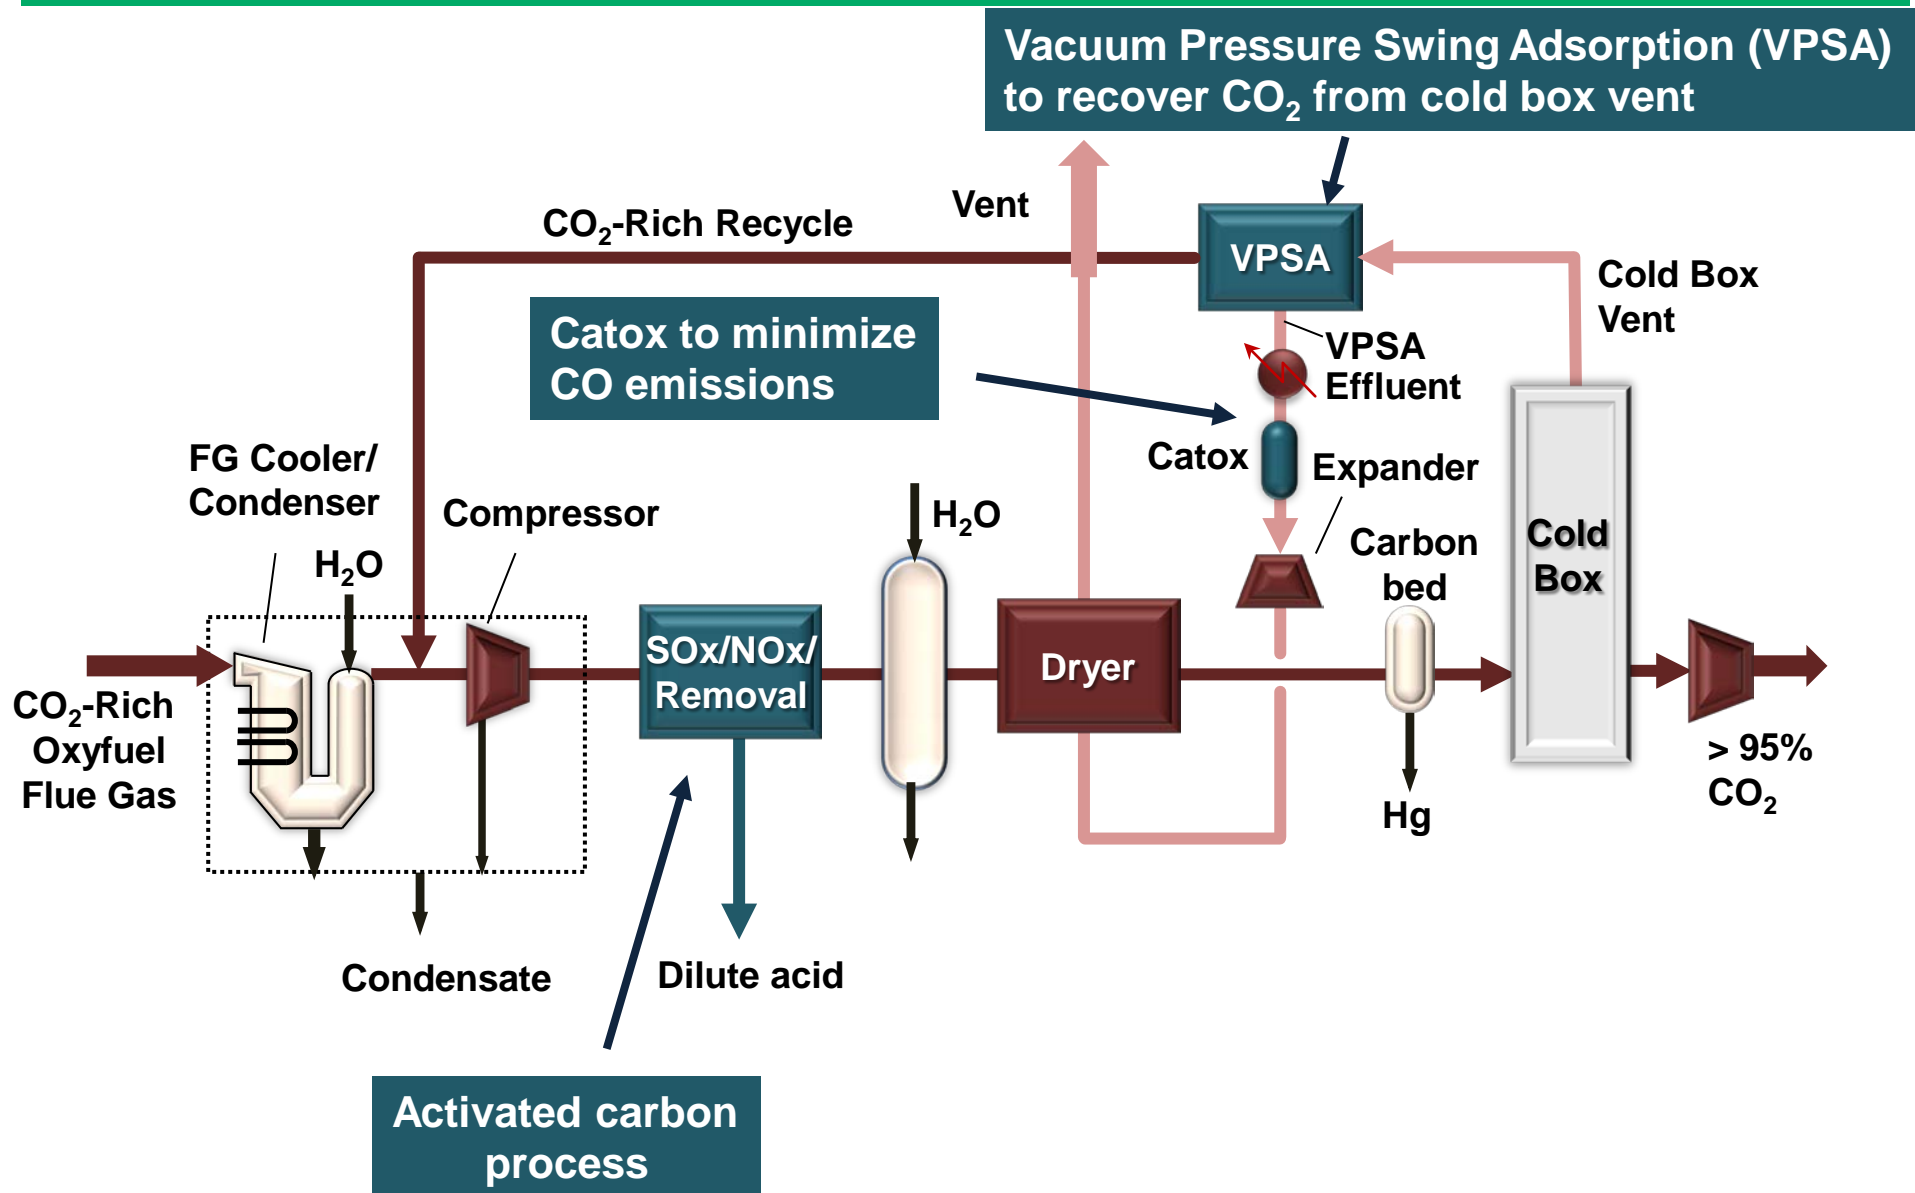

---

- ◆ **Near Zero Emissions CPU Concept**
- ◆ **Activated Carbon Process for SO<sub>x</sub>/NO<sub>x</sub> Removal**
- ◆ **Sulfuric Acid Process for SO<sub>x</sub>/NO<sub>x</sub> Removal**
- ◆ **Autorefrigeration Process**
- ◆ **VPSA for CO<sub>2</sub> Recovery from Cold Box Vent**
- ◆ **Cost and Performance**
- ◆ **R&D Needs**

# Conventional CO<sub>2</sub> Processing Unit (CPU)

# Near Zero Emissions CPU

# Activated Carbon Process Technology Concept

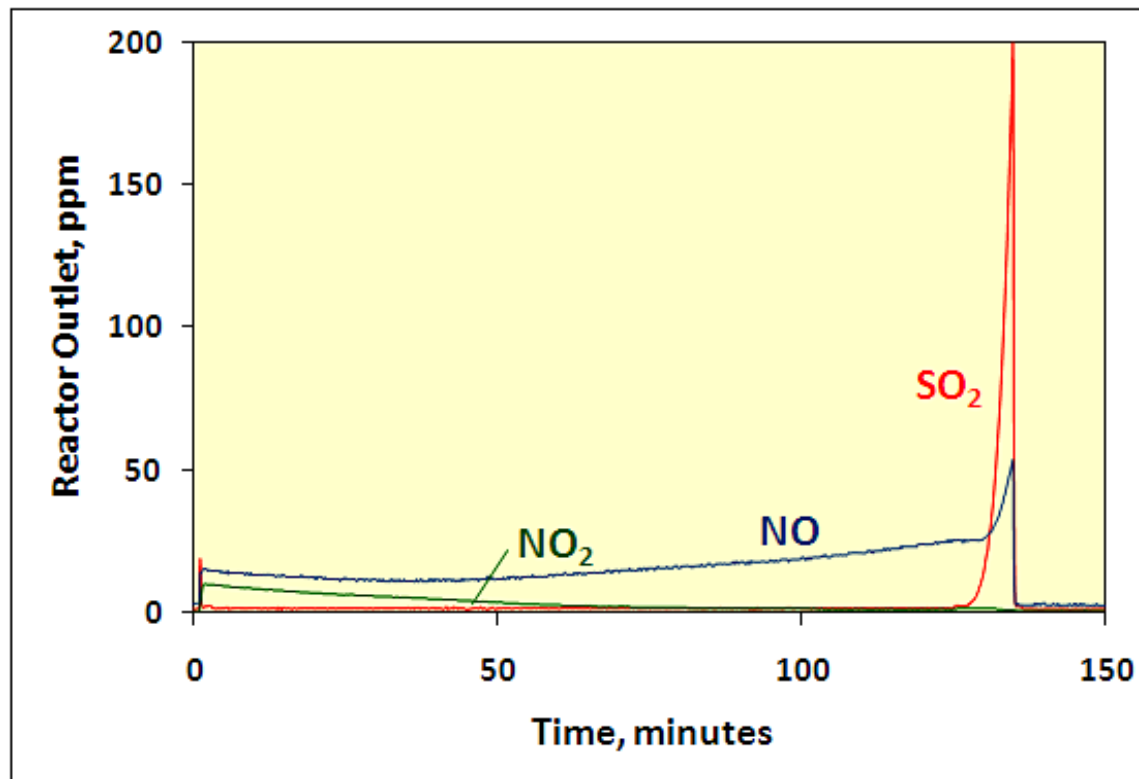

- ◆ SO<sub>2</sub> and NO are oxidized and retained on activated carbon
- ◆ Carbon is regenerated by water wash followed by drying
- ◆ Dilute acid stream is produced

# Activated Carbon Process

## SO<sub>x</sub>/NO<sub>x</sub> Concentration Profiles in Reactor Outlet

### ◆ Test system:

- Single bed unit operated in a batch mode
- Synthetic flue gas mixture: ~85% CO<sub>2</sub>, 4% O<sub>2</sub>, SO<sub>2</sub> 4000 ppm, NO 400 ppm, balance N<sub>2</sub>, saturated with moisture
- Temperature – 20 C; Pressure – 15 bar(a)

# Activated Carbon Process Test Results

	Inlet ppm		Average Outlet ppm		Removal eff. %	
	SOx	NOx	SOx	NOx	SOx	NOx
Low Sulfur Coal	450	200	2.3	13.0	99.8	93.9
Medium Sulfur Coal	2000	750	1.6	17.1	>99.9	98.2
High Sulfur Coal	4000	400	1.5	22.8	>99.9	95.2

- ◆ **Excellent simultaneous SOx/NOx removal achieved**
  - SO<sub>2</sub> >99.9 % and NOx up to 98%
- ◆ **Preliminary longevity test results were favorable**
  - Performance could be maintained over 20 cycles
- ◆ **Currently building a dual bed continuous unit for long term tests**

# Sulfuric Acid Process Technology Concept

- ◆ Recirculating  $H_2SO_4$  removes Hg, SOx and NOx in a series of contact towers
- ◆ Produce saleable  $H_2SO_4$  and  $HNO_3$
- ◆ Eliminate limestone purchase and gypsum disposal costs

# Sulfuric Acid Process

## Technoeconomic Feasibility Results

---

### ◆ Bench scale tests and simulation results

- $\text{SO}_2$  reactor and  $\text{NO}_x$  absorber projected to perform as expected, however,  $\text{NO}_x$  stripper could not remove  $\text{NO}_x$  from  $\text{H}_2\text{SO}_4$
- Process will achieve >99%  $\text{SO}_x$  removal and ~75%  $\text{NO}_x$  removal
- Residual  $\text{NO}_x$  present as  $\text{NO}_2$  which can be removed by water wash

### ◆ Economic feasibility assessment

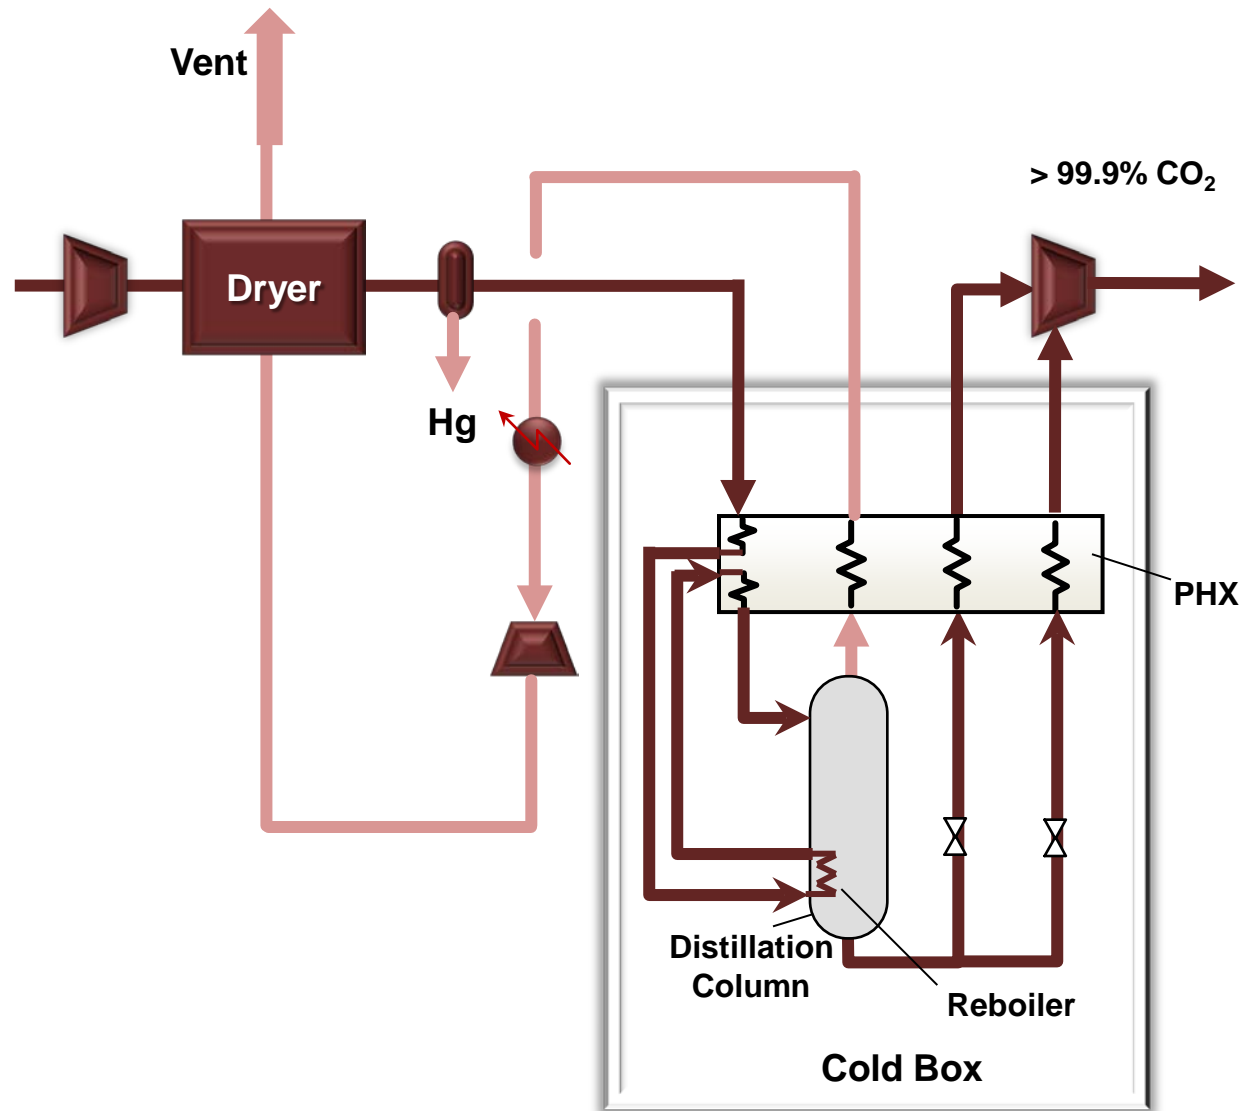

- CAPEX of  $\text{H}_2\text{SO}_4$  process will be >90% lower than the full size FGD
- However, >60% of the full size FGD is required in the boiler island for high sulfur coal
- $\text{H}_2\text{SO}_4$  containing high level of  $\text{NO}_x$  unlikely to be marketable
- Therefore, produced  $\text{H}_2\text{SO}_4$  must be neutralized and disposed off
- Value of technology similar to activated carbon process

# Autorefrigeration Process

- ◆ J-T expansion of purified LCO<sub>2</sub> for refrigeration
- ◆ Raw CO<sub>2</sub> partially liquefied by boiling product

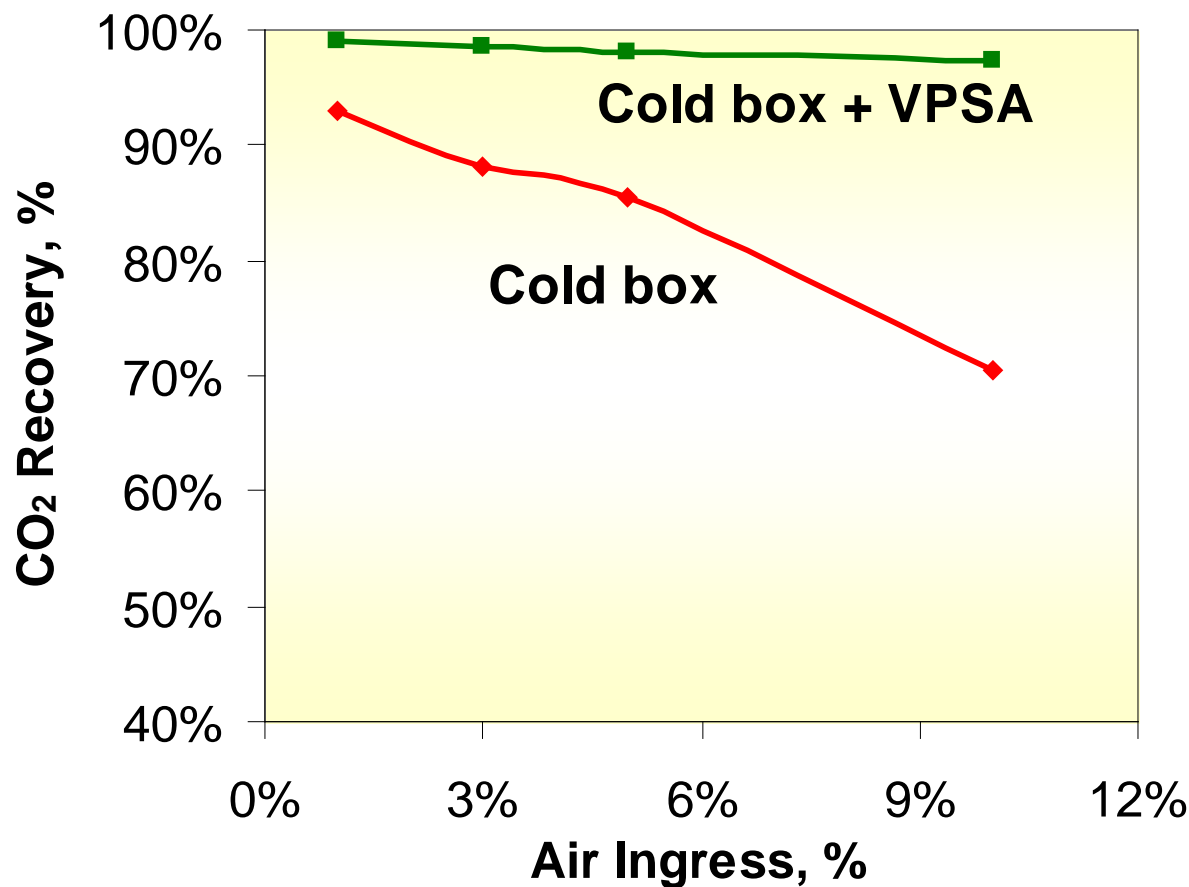

Compared to NH<sub>3</sub> refrigeration:

- ◆ Simpler process
- ◆ Lower CAPEX
- ◆ Higher CO<sub>2</sub> recovery
- ◆ Lower power

US Pat. 7,666,251

# VPSA (Vacuum Pressure Swing Adsorption) for Recovering CO<sub>2</sub> from Cold Box Vent

# VP SA Process

- ◆ Multi-bed unit for separating CO<sub>2</sub> from cold box vent stream
- ◆ Simple cycle with minimum rotating equipment
- ◆ Shallow evacuation level

# VP SA Pilot Test Results

- ◆ **Pilot unit with 12 vessels (L ~ 11', ID ~ 2.5") built**
  - Capacity – cold box vent 0.3 tpd CO<sub>2</sub> (equiv. to 3 tpd CO<sub>2</sub> in FG)
- ◆ **VP SA performance targets exceeded**
  - > 80% CO<sub>2</sub> purity and > 90% CO<sub>2</sub> recovery with VP SA
  - > 99% capture rate with VP SA + cold box

# Benefits of Praxair CPU in Comparison to Conventional CPU

# Benefits of Praxair CPU in Comparison to Conventional CPU

# Near Zero Emissions CPU Performance

Compositions			
Vol. % or ppm	CPU Feed	Purified CO <sub>2</sub>	CPU Vent
CO <sub>2</sub> , %	~61%	>99.99%	~7%
SO <sub>x</sub> , ppm	1875 ppm	2 ppm	0
NO <sub>x</sub> , ppm	156 ppm	11 ppm	9 ppm
CO, ppm	280 ppm	0	< 10 ppm

CO <sub>2</sub> Capture Rate		
Air Ingress	2%	10%
CO <sub>2</sub> capture rate, %	99%	97%

# Cost Comparison

- ◆ **Lower capture costs for NZE CPU are due to:**
  - Smaller FGD and elimination of SCR
  - Higher CO<sub>2</sub> capture rate compared to conventional CPU

Note:

1 tonne = 1000 kg

CO<sub>2</sub> purity >99.9%

CO<sub>2</sub> pressure 153 bar

CO<sub>2</sub> transportation and storage costs included

## R&D Needs for CPU

---

- ◆ **Impact of trace impurities on performance and reliability of various equipment in the process**
- ◆ **Fate of mercury in CPU**
- ◆ **Treatment and disposal of process condensate**
- ◆ **Disposal of dilute acid**
- ◆ **Demonstration and scale-up of an integrated system**

# Summary

---

- ◆ **Near zero emissions CPU technology components successfully tested at bench/pilot scale**
- ◆ **Ability to manage air ingress**
- ◆ **High CO<sub>2</sub> recovery, high purity CO<sub>2</sub> and near zero stack emissions while lowering capture costs**
