

# THE LANDSCAPE OF CARBON DIOXIDE CAPTURE, STORAGE, AND MANAGEMENT (CCSM) EDUCATION IN THE UK

*Report No. 2009/TR5*

*August 2009*

*This document has been prepared for the Executive Committee of the IEA GHG Programme.  
It is not a publication of the Operating Agent, International Energy Agency or its Secretariat.*

## INTERNATIONAL ENERGY AGENCY

The International Energy Agency (IEA) was established in 1974 within the framework of the Organisation for Economic Co-operation and Development (OECD) to implement an international energy programme. The IEA fosters co-operation amongst its 26 member countries and the European Commission, and with the other countries, in order to increase energy security by improved efficiency of energy use, development of alternative energy sources and research, development and demonstration on matters of energy supply and use. This is achieved through a series of collaborative activities, organised under more than 40 Implementing Agreements. These agreements cover more than 200 individual items of research, development and demonstration. The IEA Greenhouse Gas R&D Programme is one of these Implementing Agreements.

## ACKNOWLEDGEMENTS AND CITATIONS

This report was prepared as an account of the work sponsored by the IEA Greenhouse Gas R&D Programme. The views and opinions of the authors expressed herein do not necessarily reflect those of the IEA Greenhouse Gas R&D Programme, its members, the International Energy Agency, the organisations listed below, nor any employee or persons acting on behalf of any of them. In addition, none of these make any warranty, express or implied, assumes any liability or responsibility for the accuracy, completeness or usefulness of any information, apparatus, product or process disclosed or represents that its use would not infringe privately owned rights, including any parties intellectual property rights. Reference herein to any commercial product, process, service or trade name, trade mark or manufacturer does not necessarily constitute or imply any endorsement, recommendation or any favouring of such products.

This report was prepared by Dr João Carlos Diniz da Costa from the Centre for Coal Energy Technology, School of Chemical Engineering, The University of Queensland, Brisbane Qld 4072, Australia, under his secondment at the IEA Greenhouse Gas R&D Programme.

The report should be cited in literature as follows:

IEA Greenhouse Gas R&D Programme (IEA GHG), "The Landscape of Carbon Dioxide Capture, Storage, and Management (CCSM) Education in the UK". 2009/TR5, August 2009.

# THE LANDSCAPE OF CCSM EDUCATION IN THE UK

## Executive Summary

This report was commissioned by the IEA Greenhouse Gas R&D Programme (IEA GHG) to assist the Carbon Sequestration Leadership Forum (CSLF) task force in the assessment of international graduate degrees at MSc and PhD level on Carbon Dioxide Capture, Storage, and Carbon Management (hereinafter CCSM) from universities. The scope of this report is to identify academic perspectives and programs in the areas of CCSM currently available in the United Kingdom (UK). The information assembled in this report was sought from the internet, email contacts and visiting key universities. This report addresses the major findings and discusses the current landscape of CCSM education in the UK.

The number of postgraduate degrees and short courses in CCSM in the UK is limited, and mainly focusing on carbon management. The University of Edinburgh offers a Masters of Carbon Capture and Storage led by the School of Geo Sciences, in which carbon storage is a major component. The degree has flexibilities for those with non-geoscientists qualifications, offering introductory subjects in geology and hydrocarbons. The Universities of Nottingham, Birmingham and Loughborough (hereinafter called UNBL) consortium offers an Engineering Doctorate (Industrial) in carbon dioxide capture as part of a large capacity building programme awarded by the British Government via the Engineering and Physical Sciences Research Council (EPSRC) with further sponsorship from Industrial and Energy Companies. The program entails the graduation of 50 Engineering Doctorates in the next 7 years. Of particular attention, the engineering doctorate involves 1 year training at one of the consortium universities followed by 3 years industrial research placement. The Imperial College Masters in Sustainable Energy Futures has a strong focus energy systems and sustainability, with a subject on CCS clean fossil fuels.

Another interesting alliance is the European consortium of the Universities of Edinburgh (UK), Versailles St-Quentin (France) and Bergen (Norway) which offer PERICLES (Postdoctoral European Masters Formation on Interactions between Climate, Environment and Society). This is mainly a research degree with emphasis on modelling environmental systems. The CCS postgraduate degrees surveyed have interdisciplinary contents including subjects in the areas of economics, social, political and environment. These subjects are also core in the carbon management degrees. For those working in CCS industry, it is likely that many problems will not be technical, therefore warranting the addition of these areas of studies.

It is expected that these programs will evolve, similarly to environmental management and energy sustainability degrees offered around the world for the last 20 years, while new alliances and new programs will be available from other universities in the near future. Nevertheless, it is observed that “Regulations and Law” and “Risk Analysis” were not covered in the surveyed programs. The implementation of CCS or the management of carbon will be regulated and those involved in the CCS industry will have to be trained to fully understand the applicable regulations and laws. This is particularly important in the European context, where there are a large number of considerable small territorial area countries with complex tier government levels. In addition, risk analysis plays a major role in any industry, and the CCS industry will

have to manage important technical risks (carbon dioxide capture engineering technologies, transportation and injection and CO<sub>2</sub> leakage from storage) and non-technical risk (political, public opinion, financial and long term liability) among many other potential risks. Those working in the CCS industry will have to fully understand how risk can be incorporated in their decision making analysis and managed accordingly.

There has been a good mobilisation from the private sector and universities in offering short courses in CCSM. In terms of carbon storage, the Scottish Centre for Carbon Capture and Storage has two short courses dealing with CO<sub>2</sub> injection and storage, and in particular focusing on the education of engineers on carbon storage. No short courses were found in carbon dioxide capture, and the majority of the other short courses available are mainly on carbon footprint, and potentially addressing new guidelines and standards (PA2050 and ISO 14067). The short courses offered by IFF, ICAP Plc and CEAG Ltd, include risks, regulation and carbon markets. These courses may be geared to training managers and financial traders.

The majority of the postgraduate programs surveyed include the conventional course delivery per semester and requiring a dissertation. This delivery mode may suit full time students. The Imperial College Masters in Sustainable Energy Features is more focused on intensive two week courses which include lecturing, tutorials and exercises. The Imperial College also has an interesting subject of 'Distinguished Speakers Seminars'. Students are required to attend 10 seminars to complete the subject. The University of Edinburgh allows for industrial projects as part of their masters of carbon capture and storage. The UNBL consortium has a program strongly focused on carbon dioxide capture industrial research. The UNBL consortium also offers Summer School programs as part of their curriculum, which includes a range of seminars by invited speakers and problem solving activities.

The important question in course delivery mode is 'what is the profile of the CCSM student'? Under the perspective of education in capacity building programs, there will be a need of a new generation of engineers, scientists, managers and analysts to be trained to attain the set of skills needed to deal with CCSM issues in the future. This new generation will be mainly full time students endeavouring to take conventional masters or doctorate degrees. By the same token, the current generation of professionals working in the energy industry may desire to upgrade their skills and CCSM knowledge. The current generation are more likely to be part time students opting for degrees with intensive courses (1 or 2 weeks), attending seminars and summer schools. In other words, current and future CCSM programs should cater for different segments of the educational market.

This report has concentrated on courses provided in the UK. In addition, mention should be made that from a base in the UK the IEA GHG organises an annual International CCS Summer School. This is hosted at different locations worldwide each time; Germany, Canada and Australia in the first three years. This course offers an intensive week in all aspects of CCS, from capture to storage, and non-technical topics such as economics, policy, regulation, safety and public communication.

# 1 Introduction

This report was commissioned by the IEA Greenhouse Gas R&D Programme (IEA GHG) to assist the Carbon Sequestration Leadership Forum (CSLF) task force in the assessment of international graduate degrees at MSc and PhD level on Carbon Capture Storage and Carbon Management for universities. The acronym CCSM is used hereinafter to Carbon Dioxide Capture, Storage, and Carbon Management while CCS is specifically used for Carbon Dioxide Capture and Storage only.

The scope of this report is to identify academic perspectives and programs in the areas of CCS and Carbon Management currently available in the United Kingdom (UK). The information assembled in this report was sought from the internet, email contacts and visiting key universities in CCSM in the UK. This report addresses the major findings and discusses the current landscape of CCSM education in the UK.

Disclaimer: The information assembled in this report was summarised and it does not serve the purpose of advertising any of the individual programs available in the UK. For all intents and purposes, this report neither provides an assessment of the quality of courses available nor does it serve as guidance for entry requirements in any of the institutions mentioned.

## 2 Methodology

The information assembled in this report was sought from the internet using search words such as 'carbon', 'carbon capture', 'carbon sequestration' and 'carbon management'. Several leading universities in the UK were personally contacted via email, while meetings were held at the University of Nottingham and the Imperial College to discuss their academic programs in these areas.

## 3 CCSM Educational Programs

### 3.1 Mapping Postgraduate Degrees

In this session, postgraduate degrees are mapped according to their compulsory and elective subjects as listed in Table 1. Detailed information of these courses can be found in Appendix 1. In order to summarise the information in a relevant manner, the following criteria was followed:

- (C) Capture: Subjects in engineering and science of CO<sub>2</sub> capture from flue gas stream, incorporating transportation.
- (S) Storage: Subjects in geology and science of CO<sub>2</sub> storage
- (E) Environmental: Subjects in climate change, environmental sciences and management, including modelling, geography and town planning.
- (X) Economy, Social and Political: Subjects in CO<sub>2</sub> studies in these fields of Science.

Table 1 – Doctorate and Masters Course Mapping

| Institution   | Degree  | Compulsories |   |   |   | Electives |   |   |   |
|---|---|--------------|---|---|---|-----------|---|---|---|
|   |   | C            | S | E | X | C         | S | E | X |
| U. of Edinburgh<br>School of GeoSciences  | Masters of Carbon Capture and Storage   | █            | █ |   | █ | █         | █ |   | █ |
| U. of Edinburgh<br>Business School  | Masters of Carbon Management  |              |   | █ | █ |           |   | █ | █ |
| EUROPEAN: U. of Edinburgh (UK), U. of Versailles St-Quentin (France), U. of Bergen (Norway) | PERICLES – Postdoctoral European Masters Formation on Interactions Between Climate, Environment and Society |              |   | █ | █ |           |   |   |   |
| Imperial College<br>Institute of Energy Futures   | Masters in Sustainable Energy Futures   | █            |   |   | █ | █         |   | █ |   |
| U. of Nottingham, Birmingham and Loughborough<br>Schools of Engineering                     | Engineering Doctorate (Industrial) and Masters in Carbon Capture  | █            |   |   | █ | █         |   |   | █ |
| U. of Glasgow<br>Crichton Carbon Centre   | Masters of Carbon Management  |              |   | █ | █ |           |   | █ | █ |
| U. of Lancaster<br>School of Engineering  | Masters of Low Carbon Emission  |              |   | █ |   |           |   | █ |   |

### 3.2 Entry Requirements

The majority of the courses listed in Table 1 have a minimum entry requirement of class 2.1 in a relevant degree in Engineering, Science or the Arts, or an equivalent form of overseas qualification. In some cases, candidates with an adequate component of mathematics, or extensive relevant postgraduate experience will also be considered.

### 3.3 Carbon Dioxide Capture

The two leading institutions in carbon dioxide capture are the consortium of the Universities of Nottingham, Birmingham and Loughborough (hereinafter called UNBL), and the University of Edinburgh. The component of carbon dioxide capture appears to be minor in the Masters of Carbon Capture and Storage offered by the University of Edinburgh. The Imperial College has a Masters in Sustainable Energy Futures has a strong focus on engineering, energy systems and sustainability, with a subject on clean fossil fuels which incorporates CCS concepts.

The Engineering Doctorate (Industrial) and Masters of Carbon Capture offered by the UNBL consortium is part of a large capacity building programme awarded by the British Government via the Engineering and Physical Sciences Research Council (EPSRC). The UNBL consortium was awarded the EPSRC Engineering Doctorate Centre with further industrial sponsorship from Air Products Ltd, Alstom Power Ltd, E.ON, Rolls Royce Plc, RWE nPower, Welsh Power Ltd, Drax Power Ltd, Corus, CPL Ltd, Doosan Babcock and Innospec Inc. The program entails the graduation of 50 Engineering Doctorates in the next 7 years. It should be noted that the engineering doctorate involves 1 years training at one of the consortium universities followed by

a 3 year industrial research placement. Hence, the program has a strong focus on industrial carbon dioxide capture research.

### **3.4 Storage**

The University of Edinburgh offers a Masters of Carbon Capture and Storage led by the School of GeoSciences, in which storage is a major component of the degree. The degree has flexibilities for those with non-geoscientists qualifications, with requirements in introductory subjects in geology and hydrocarbons in order to graduate. To date, this is the only masters program focusing on carbon storage in the UK.

### **3.5 Environmental**

The majority of the programs offer environmental subjects. This is important as CCSM are part of the big picture concept, and their relations, interactions and impact upon the environment must be fully understood. Of particular attention, the European consortium of the Universities of Edinburgh (UK), Versailles St-Quentin (France) and Bergen (Norway) are offering the PERICLES (Postdoctoral European Masters Formation on Interactions between Climate, Environment and Society). This is mainly a research degree with emphasis on modelling environmental systems, particularly focused on climate change.

### **3.6 Economic, Social and Political**

Economic, social and political issues are very important facets of CCSM, and this is rightly reflected by the inclusions of subjects in these areas in the majority of the courses surveyed. These are also core subjects in the carbon management degrees. It is generally the case that technically minded professionals also need further training in the management aspects relevant to their working positions. For those working in the CCS industry, it is likely that many issues will not be technical, therefore warranting the addition of economic, social and political training.

### **3.7 Other Programs**

An example of other programs is the masters of low carbon emission offered by the University of Lancaster. Although this program has a strong engineering focus, mainly on nuclear power and renewable energies, the program has no carbon dioxide capture component. There are a large number of masters courses in the UK currently being offered in power engineering, energy systems, sustainable energy, low energy building etc. Perhaps the motivation of many of these courses is on reduction of carbon emissions, or the efficient production of fossil fuel energy. Based on our search, these courses were not specifically addressing CCS or carbon management, and therefore were not considered in this report.

### **3.8 Program Gaps**

Although we have not been privy to the syllabuses for each of the subjects offered in the programs listed in Table 1, their titles gave us an indication of the potential contents of each subject. It is expected that these programs will evolve, similarly to environmental management

and energy sustainability masters degrees offered in the last 20 years, while new alliances and new programs will be available from other universities in the near future. Nevertheless, it is observed that “Regulations and Law” and “Risk Analysis” were not covered in these programs.

The implementation of CCS or the management of carbon will be regulated and those involved in CCS industry will have to be trained to fully understand the applicable regulations and laws. This is particularly important in the European context, where there are a large number of considerably small territorial area countries (as opposed to Australia, USA, Canada, China and Russia), with complex tier levels ranging from local government, to central governments in each country, and finally the European Union.

In addition, risk per se has many facets associated with non-technical risks (political, public opinion, financial risks and long term liability), and technical risks (carbon dioxide capture engineering technologies, transportation and injection, and CO<sub>2</sub> leakage for storage) among many other potential risks. Those working in the CCS industry will have to fully understand how risk can be incorporated in their decision making analysis. Our society has transient views and managing CCS risk appropriately will be a day to day activity in the industry.

## 4 CCSM Short Courses

The short courses in CCSM sought from our internet search and being offered by Universities and the private sector are listed in Tables 2 and 3, respectively. In this report, we only included those courses that were actually available in 2009, as several other courses were described, but no course delivery dates were given. Further information about these courses is included in Appendices 2 and 3.

In terms of carbon storage, the Scottish Centre for Carbon Capture and Storage has two short courses dealing with CO<sub>2</sub> injection and storage, focusing particularly on the education of engineers in CO<sub>2</sub> storage. The majority of the remaining short courses are mostly on carbon footprints, and potentially addressing new guidelines and standards (PA2050 and ISO 14067). These types of short courses follow the educational evolution of training courses which started in the 1980’s with quality control systems, waste management followed by environmental management systems, cleaner production, sustainability and eco labelling. The short courses offered by IFF, ICAP Plc and CEAG Ltd, include risks, regulation and carbon markets. These courses may be geared to training managers and financial traders.

Table 2 - University Short Courses

| Institution  | Title   | C | S | E | X |
|--|---|---|---|---|---|
| Scottish Centre for and Storage - U. of Edinburgh      | CO <sub>2</sub> Storage for Engineers                     |   |   |   |   |
| Scottish Centre for Carbon Capture and Storage - U. of | CO <sub>2</sub> Injection and Enhanced Oil recovery (EOR) |   |   |   |   |

|  |   |  |  |  |  |
|--|---|--|--|--|--|
| Edinburgh  |   |  |  |  |  |
| U. of Glasgow – Crichton Carbon Centre             | Introduction to Carbon Management   |  |  |  |  |
| U. of Manchester Sustainable Consumption Institute | CPD Course in Carbon Footprint  |  |  |  |  |
| U. of Bath   | On Line Course – Primer on Carbon Footprinting of Consumer Goods and Services |  |  |  |  |
| U. of East Anglia Low Carbon Innovation Centre     | Carbon Management Skills  |  |  |  |  |

Table 3 – Private Sector Short Courses

| Institution                            | Title   | C | S | E | X |
|--|---|---|---|---|---|
| ICAP Plc and CEAG Ltd                  | Foundation Emissions Course: Regulation, Risk Management and Carbon Pricing |   |   |   |   |
| IFF – International Faculty of Finance | Carbon Trading, Risk and Strategy   |   |   |   |   |
| GP Training Consultants                | Introduction to the UK Carbon Reduction Commitment                          |   |   |   |   |
| BSI Group                              | Calculating your Carbon Footprint Training Course                           |   |   |   |   |
| Aspects International                  | IEMA Approved Carbon Footprint Management Course                            |   |   |   |   |

Although this report has concentrated on courses provided in the UK, in addition, from a base in the UK the IEA GHG organises an annual International CCS Summer School. This is hosted at different locations worldwide each time; Germany, Canada and Australia in the first three years. This course offers an intensive week in all aspects of CCS, from capture to storage, and non-technical topics such as economics, policy, regulation, safety and public communication. A feature of the course is the assignments given to the students for group work. Some 170 students have undertaken this course to date.

## 5 Course Delivery

In this section, postgraduate degrees are mapped according to their delivery mode as listed in Table 4. In order to summarise the information in a relevant manner, the following criteria was followed:

- (C) Conventional: The course is delivered during a full semester.
- (SS) Summer School: The course is part of a Summer School
- (I) Intensive: The course is delivered within a week or two week period, and may involve a series of lectures and tutorial sessions.
- (DS) Distinguished Speaker: The course includes a series of seminars from distinguished speakers in the area of CCSM
- (R) Research: The course requires a dissertation at Masters level or a major laboratory research project as part of a PhD degree.

- (IR) Industrial Research: The course allows students to take industrial projects as part of dissertation at Masters’ level or a major industrial research project as part of an engineering doctorate degree.

Table 4 – Doctorate and Masters Delivery Mode

| Institution   | Degree  | C | SS | I | DS | R | IR |
|---|---|---|----|---|----|---|----|
| U. of Edinburgh<br>School of GeoSciences  | Masters of Carbon Capture and Storage   | ■ |    |   |    | ■ | ■  |
| U. of Edinburgh<br>Business School  | Masters of Carbon Management  | ■ |    |   |    | ■ |    |
| EUROPEAN: U. of Edinburgh (UK), U. of Versailles St-Quentin (France), U. of Bergen (Norway) | PERICLES – Postdoctoral European Masters Formation on Interactions Between Climate, Environment and Society | ■ |    |   |    | ■ |    |
| Imperial College<br>Institute of Energy Futures   | Masters in Sustainable Energy Futures   |   |    | ■ | ■  | ■ |    |
| U. of Nottingham, Birmingham and Loughborough<br>Schools of Engineering                     | Engineering Doctorate (Industrial) and Masters in Carbon Capture  | ■ | ■  |   |    | ■ | ■  |
| U. of Glasgow<br>Crichton Carbon Centre   | Masters of Carbon Management  | ■ |    |   |    | ■ | ■  |
| U. of Lancaster<br>School of Engineering  | Masters of Low Carbon Emission  | ■ |    |   |    | ■ |    |

Table 4 shows that the majority of the programs include the conventional delivery of course per semester and require a dissertation. This delivery mode is suitable for full time students. The Imperial College Masters in Sustainable Energy Features delivers intensive two week courses which include lecturing, tutorials and exercises. The Imperial College also has an interesting subject of ‘Distinguished Speakers Seminars’. Students are required to attend 10 seminars to complete the subject. The Imperial College delivery mode may suit professionals where time limitations and commitments do not allow for long absence from work while the seminar series adds value as students are exposed to CCSM views and visions from experts in the field.

The University of Edinburgh allows for industrial projects as part of their masters of carbon capture and storage. By the same token the UNBL consortium has a program strongly focused on carbon dioxide capture industrial research. This program caters to technically minded students interested in carbon dioxide capture technologies and their integration in energy systems for the purpose of improvements, optimisation and intensification, in addition to new discoveries. The UNBL consortium also offers Summer School programs as part of their curriculum, which includes a range of seminars by invited speakers and problem solving activities.

The important question in course delivery mode is ‘what is the profile of the CCSM student’? Under the perspective of education in capacity building programs, there will be a need of a new generation of engineers, scientists, managers and analysts to be trained to attain the set of skills needed to deal with CCSM issues in the future. This new generation will be mainly full time

students endeavouring to take conventional masters or doctorate degrees. On the other hand, the current generation of professionals working in the energy industry may desire to upgrade their skills and CCSM knowledge. This current generation are more likely to be part time students opting for degrees with intensive courses (1 or 2 weeks), seminars and summer schools. In other words, current and future CCSM programs should cater for different segments of the educational market.

## 6 Postgraduate Degree Options

In this section, postgraduate degrees are mapped according to degree options as listed in Table 5. In order to summarise the information in a relevant manner, the following criteria was followed:

- (C) Postgraduate Certificate: Generally equivalent to 1/3 of masters degree.
- (D) Postgraduate Diploma: Generally equivalent to 2/3 of masters degree
- (M) Masters: Full coursework plus dissertation or industrial project leading to the award of MSc or equivalent Masters level degree.
- (ED) Engineering Doctorate: Industrial research theses leading to the award of Engineering Doctor degree.

Table 5 – Doctorate and Masters Degree Options

| Institution   | Degree  | C | D | M | ED |
|---|---|---|---|---|----|
| U. of Edinburgh<br>School of GeoSciences  | Masters of Carbon Capture and Storage   |   |   |   |    |
| U. of Edinburgh<br>Business School  | Masters of Carbon Management  |   |   |   |    |
| EUROPEAN: U. of Edinburgh (UK), U. of Versailles St-Quentin (France), U. of Bergen (Norway) | PERICLES – Postdoctoral European Masters Formation on Interactions Between Climate, Environment and Society |   |   |   |    |
| Imperial College<br>Institute of Energy Futures   | Masters in Sustainable Energy Futures   |   |   |   |    |
| U. of Nottingham, Birmingham and Loughborough<br>Schools of Engineering                     | Engineering Doctorate (Industrial) and Masters in Carbon Capture  |   |   |   |    |
| U. of Glasgow<br>Crichton Carbon Centre   | Masters of Carbon Management  |   |   |   |    |
| U. of Lancaster<br>School of Engineering  | Masters of Low Carbon Emission  |   |   |   |    |

Table 5 shows that CCSM degrees are offered as a Masters degree with an option for postgraduate diploma, except for the Imperial College and the European PERICLES programs. The UNBL consortium program allows an exit clause for the students enrolled in the Engineering Doctorate. If the number of courses and credits are deemed to comply with Masters regulations, students may complete their degree as a MSc in carbon capture instead, or are awarded a postgraduate certificate or diploma. The postgraduate degree options provide

flexibility in the education market, a practice found in other parts of the world for those constrained by financial or work limitations. There are also a large number of research works on CCSM being carried out in the UK that are funded by the Industry, EPSCR and European Community, and other agencies. These are generally offered at high research level (PhD) and are not part of the scope of this report.

## 7 Conclusions and Recommendations

The number of postgraduate degrees and short courses in CCSM in the UK is limited, and mainly focusing on carbon management. The University of Edinburgh offers a Masters of Carbon Capture and Storage led by the School of GeoSciences, in which carbon storage is a major component. The UNBL consortium offers an Engineering Doctorate (Industrial) in carbon dioxide capture aiming at graduating 50 Engineering Doctorates in the next 7 years. Another interesting alliance is the European consortium of the Universities of Edinburgh (UK), Versailles St-Quentin (France) and Bergen (Norway) which offers PERICLES (Postdoctoral European Masters Formation on Interactions between Climate, Environment and Society). The CCS postgraduate degrees surveyed have interdisciplinary contents including subjects in the areas of economics, social, political and environment. These subjects are also core in the carbon management degrees. Nevertheless, it is observed that “Regulations and Law” and “Risk Analysis” were not covered in the surveyed programs. It is recommended that these areas are considered for future Masters Curricula in CCSM.

The majority of the postgraduate programs surveyed include the conventional course delivery per semester and requiring a dissertation, which can be replaced by an industrial project or industrial research. This delivery mode may suit full time students. More flexible modes include intensive two week courses, attending seminars and summer schools, which are tailored to part time students. CCSM postgraduate degrees offered as a Masters or Doctorate levels have exit options for awards as postgraduate certificate or diploma.

There has been a good mobilisation from the private sector and universities in offering short courses in CCSM. In terms of carbon storage, the Scottish Centre for Carbon Capture has two short courses dealing with CO<sub>2</sub> injection and storage, and in particular focusing on the education of engineers on carbon storage. No short courses were found in carbon dioxide capture, and the majority of the other short courses available are mainly on carbon footprint, and potentially addressing new guidelines and standards (PA2050 and ISO 14067).

In addition, mention should be made that from a base in the UK the IEA GHG organises an annual International CCS Summer School. This is hosted at different locations worldwide each time; Germany, Canada and Australia in the first three years. This course offers an intensive week in all aspects of CCS, from capture to storage, and non-technical topics such as economics, policy, regulation, safety and public communication..

## Appendix 1: Data Base of CCSM High Degrees in the UK

|   |  |
|---|--|
| <b>Institution</b>  | <b>University of Edinburgh</b>   |
| School  | School of GeoSciences  |
| Degree  | Masters of Carbon Capture and Storage  |
| Degree Option   | Diploma of Carbon Capture and Storage  |
| Length  | 12 months (full time) 36 months (part time)  |
